CONTEXT

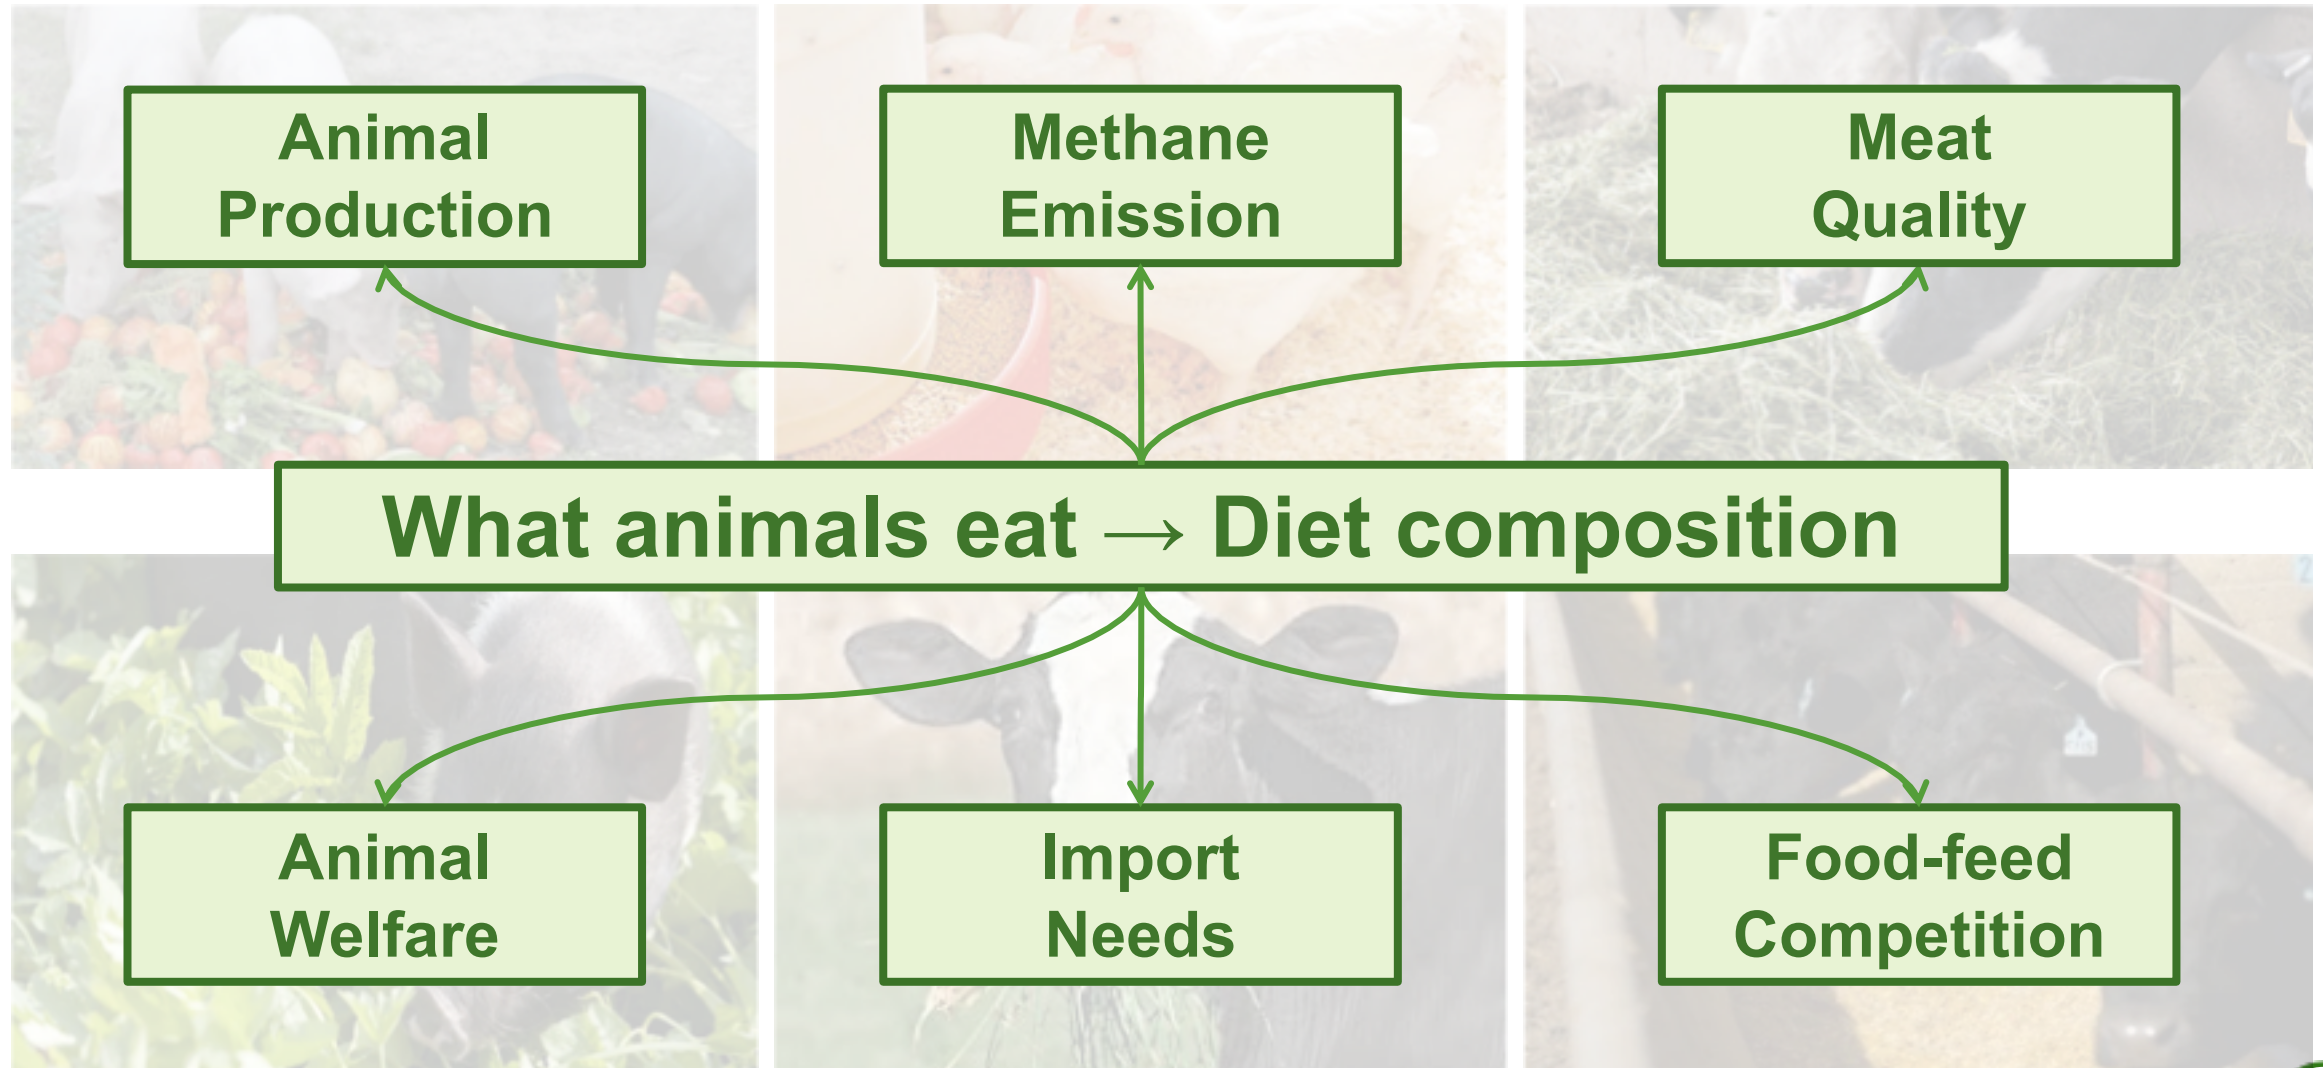

CONTEXT

WHAT DO ANIMALS EAT?

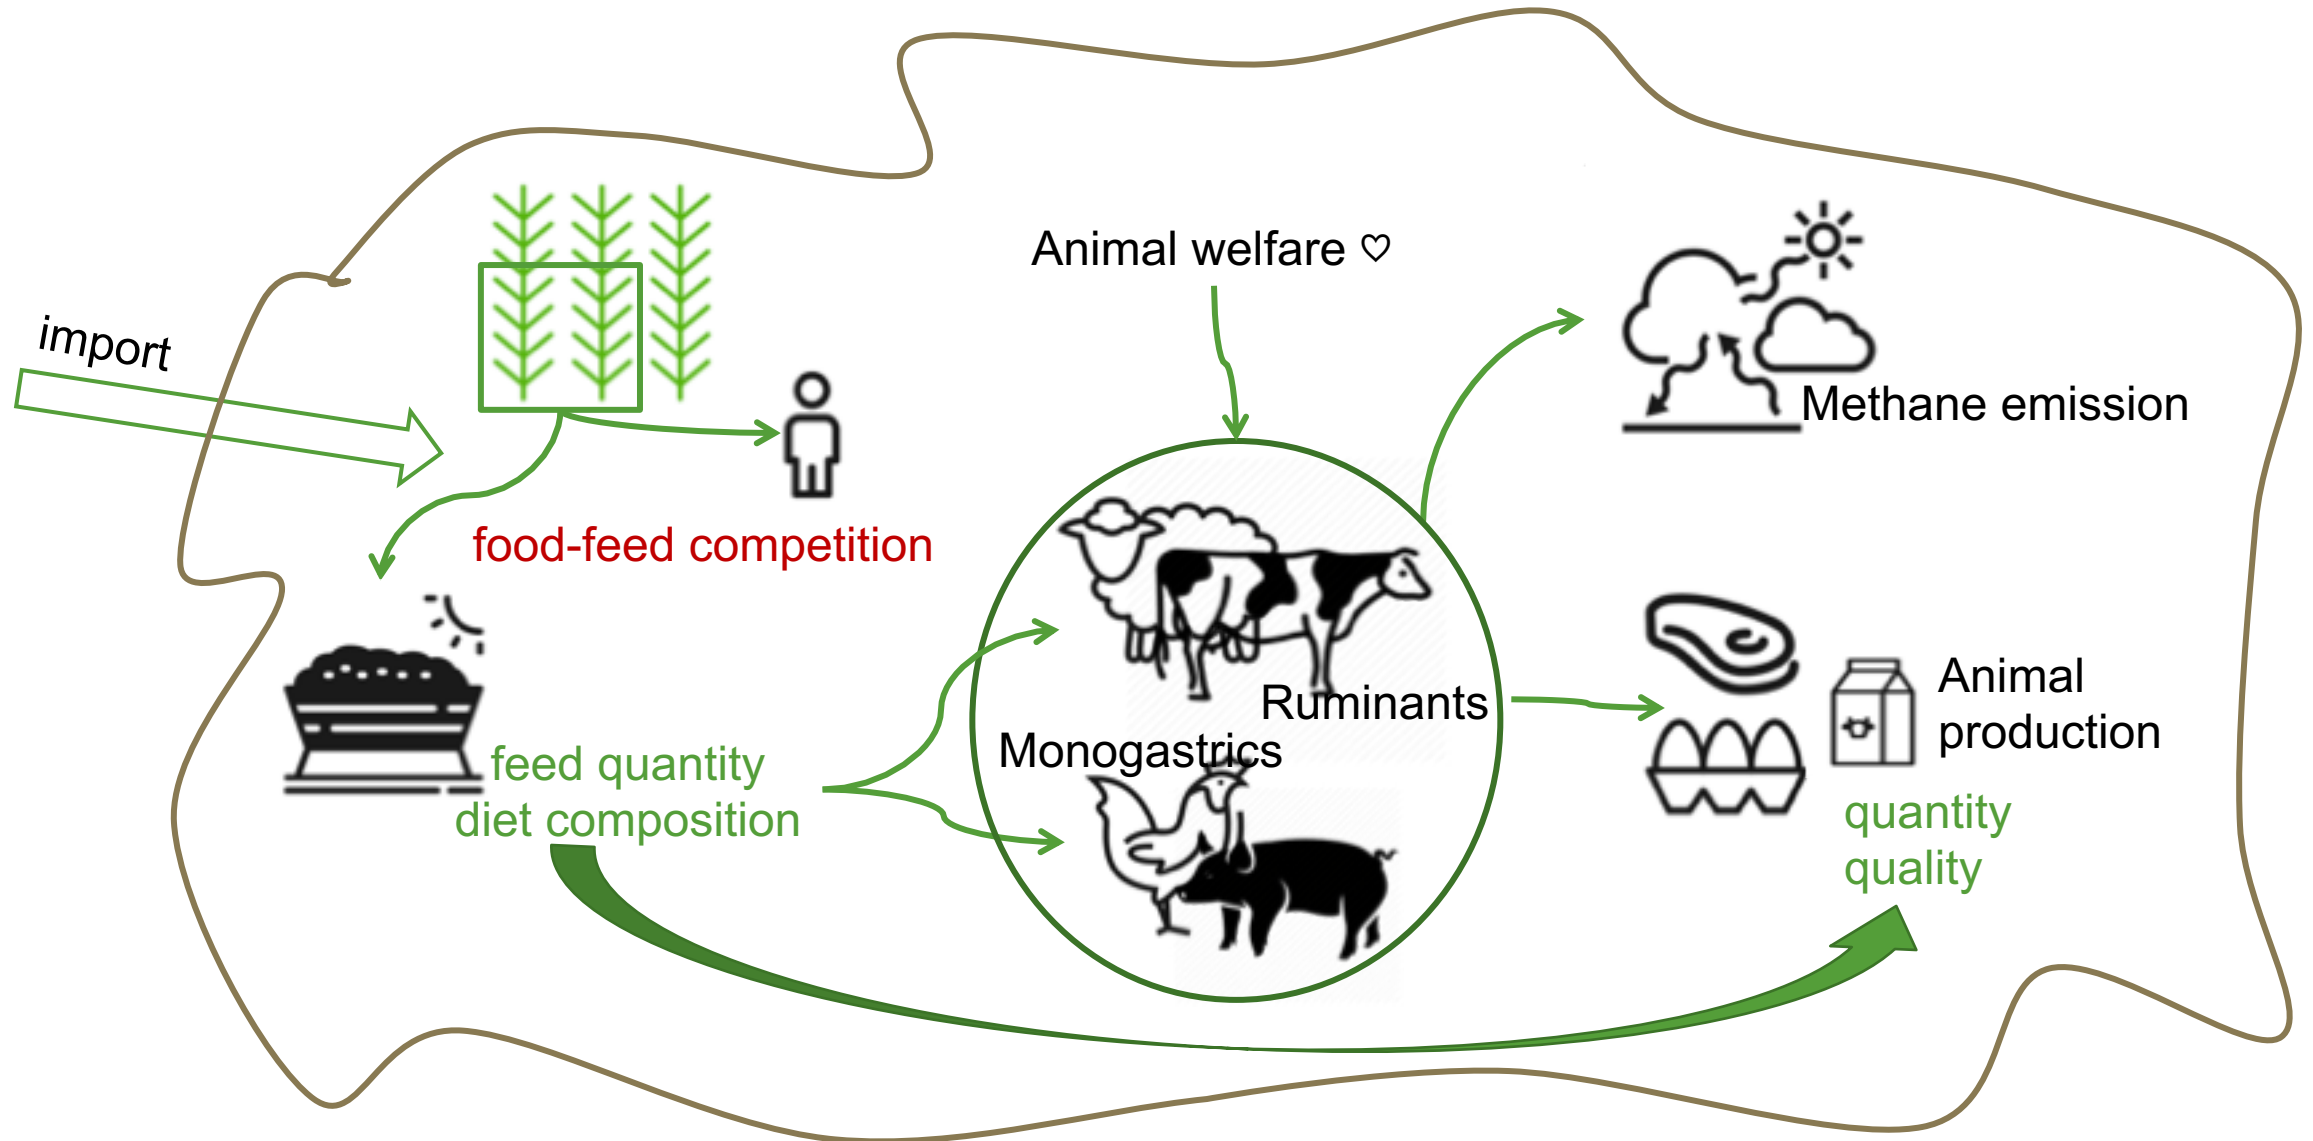

CONTEXT

OBJECTIVES

- A. the **feed intake** and **diet composition** for monogastric animals and ruminants
- B. **animal production** (meat, milk, eggs), **methane emissions**, **meat quality**, **animal welfare** and **resources** management
- C. French regional scale

Methodology (schematic plan)

Methodology (schematic plan)

Methodology (schematic plan)

Categories for livestock and feed

Feed Categories Animal Categories		Cereals	Co-products	Meals	Oil and Protein	Forage	Grass
Ruminants	Young Cattle						
	Steers (non-castrated)						
	Bulls (castrated)						
	Heifers (females)						
	Dairy Cows						
Monogastrics	Growing Pigs						
	Adult Pigs						
	Broilers						
	Laying Hens						

Drivers of the model

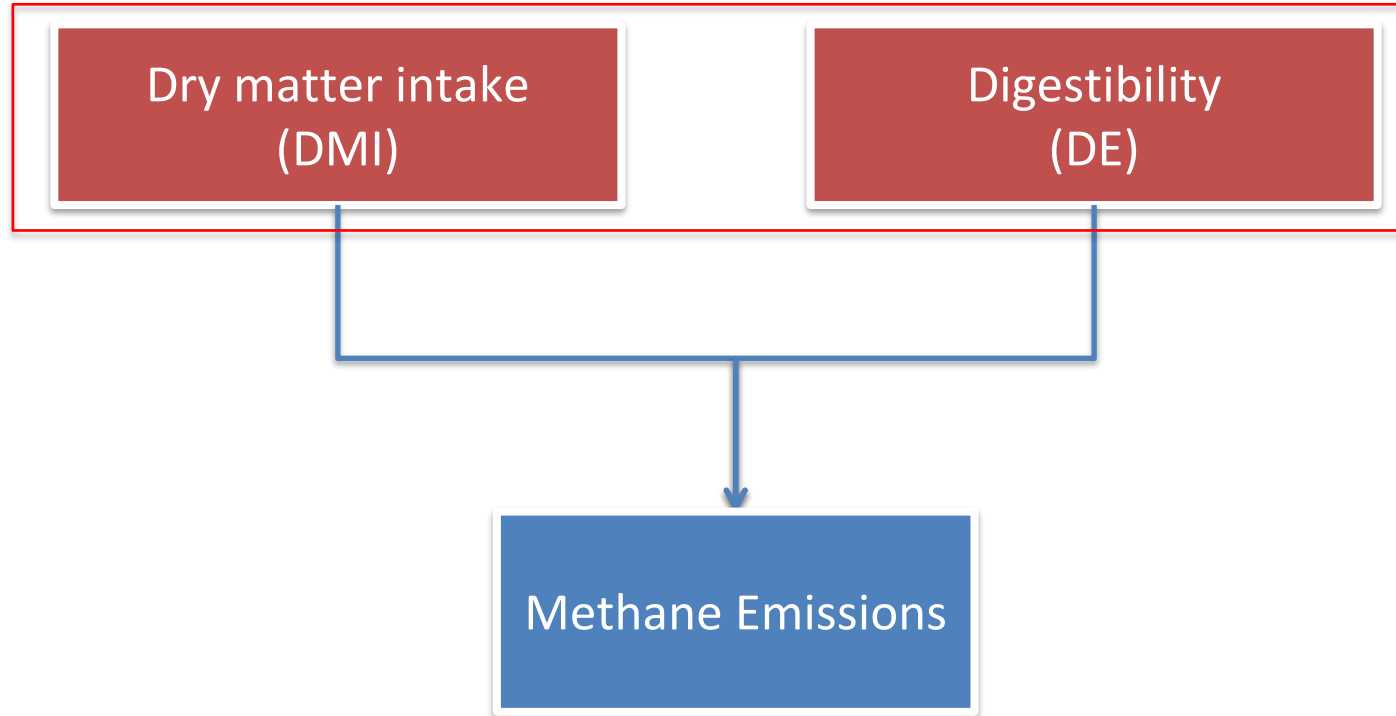

Dry matter intake
(DMI)

Digestibility
(DE)

- Feed item for different animal categories
- Quantity for each feed item
- Gross energy for each feed item

Calculations of Methane Emission

Methodology (calculations for methane emissions)

$$EF = \frac{GE \cdot \left(\frac{Y_m}{100} \right) \cdot 365}{55.65}$$

Where:

EF = emission factor, kg CH₄ head⁻¹ yr⁻¹

GE = gross energy intake, MJ head⁻¹ day⁻¹

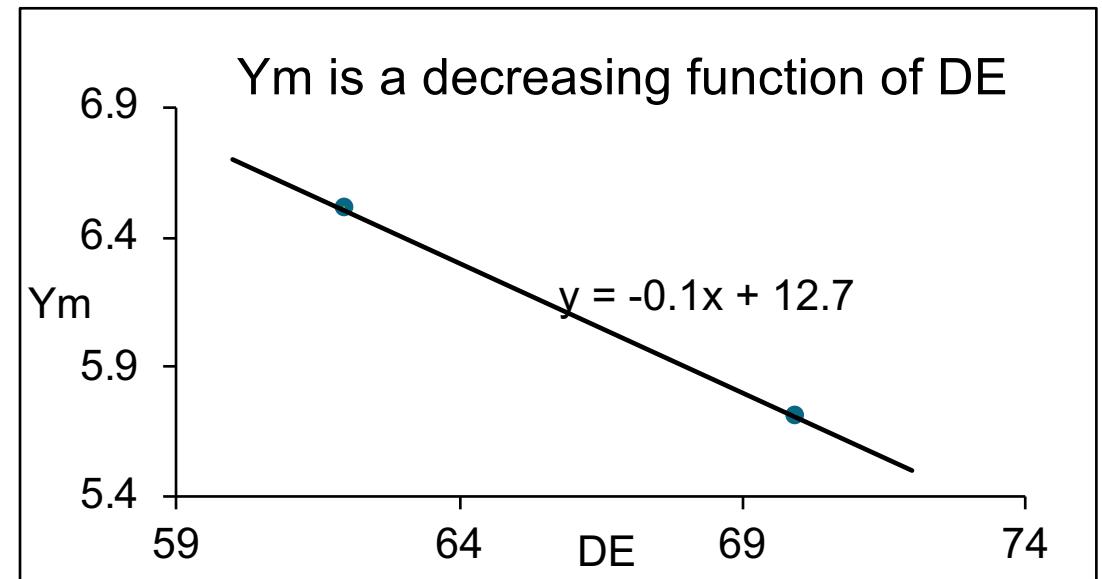

Y_m = methane conversion factor, % of gross energy in feed converted to methane (related to DE)

The factor 55.65 (MJ/kg CH₄) is the energy content of methane

From: IPCC. 2006. 2006 IPCC Guidelines for National Greenhouse Gas Inventories, Volume 4: Agriculture, Forestry and Other Land Use. Intergovernmental Panel on Climate Change.

Dairy Cows Methane Conversion Factor (Y_m)

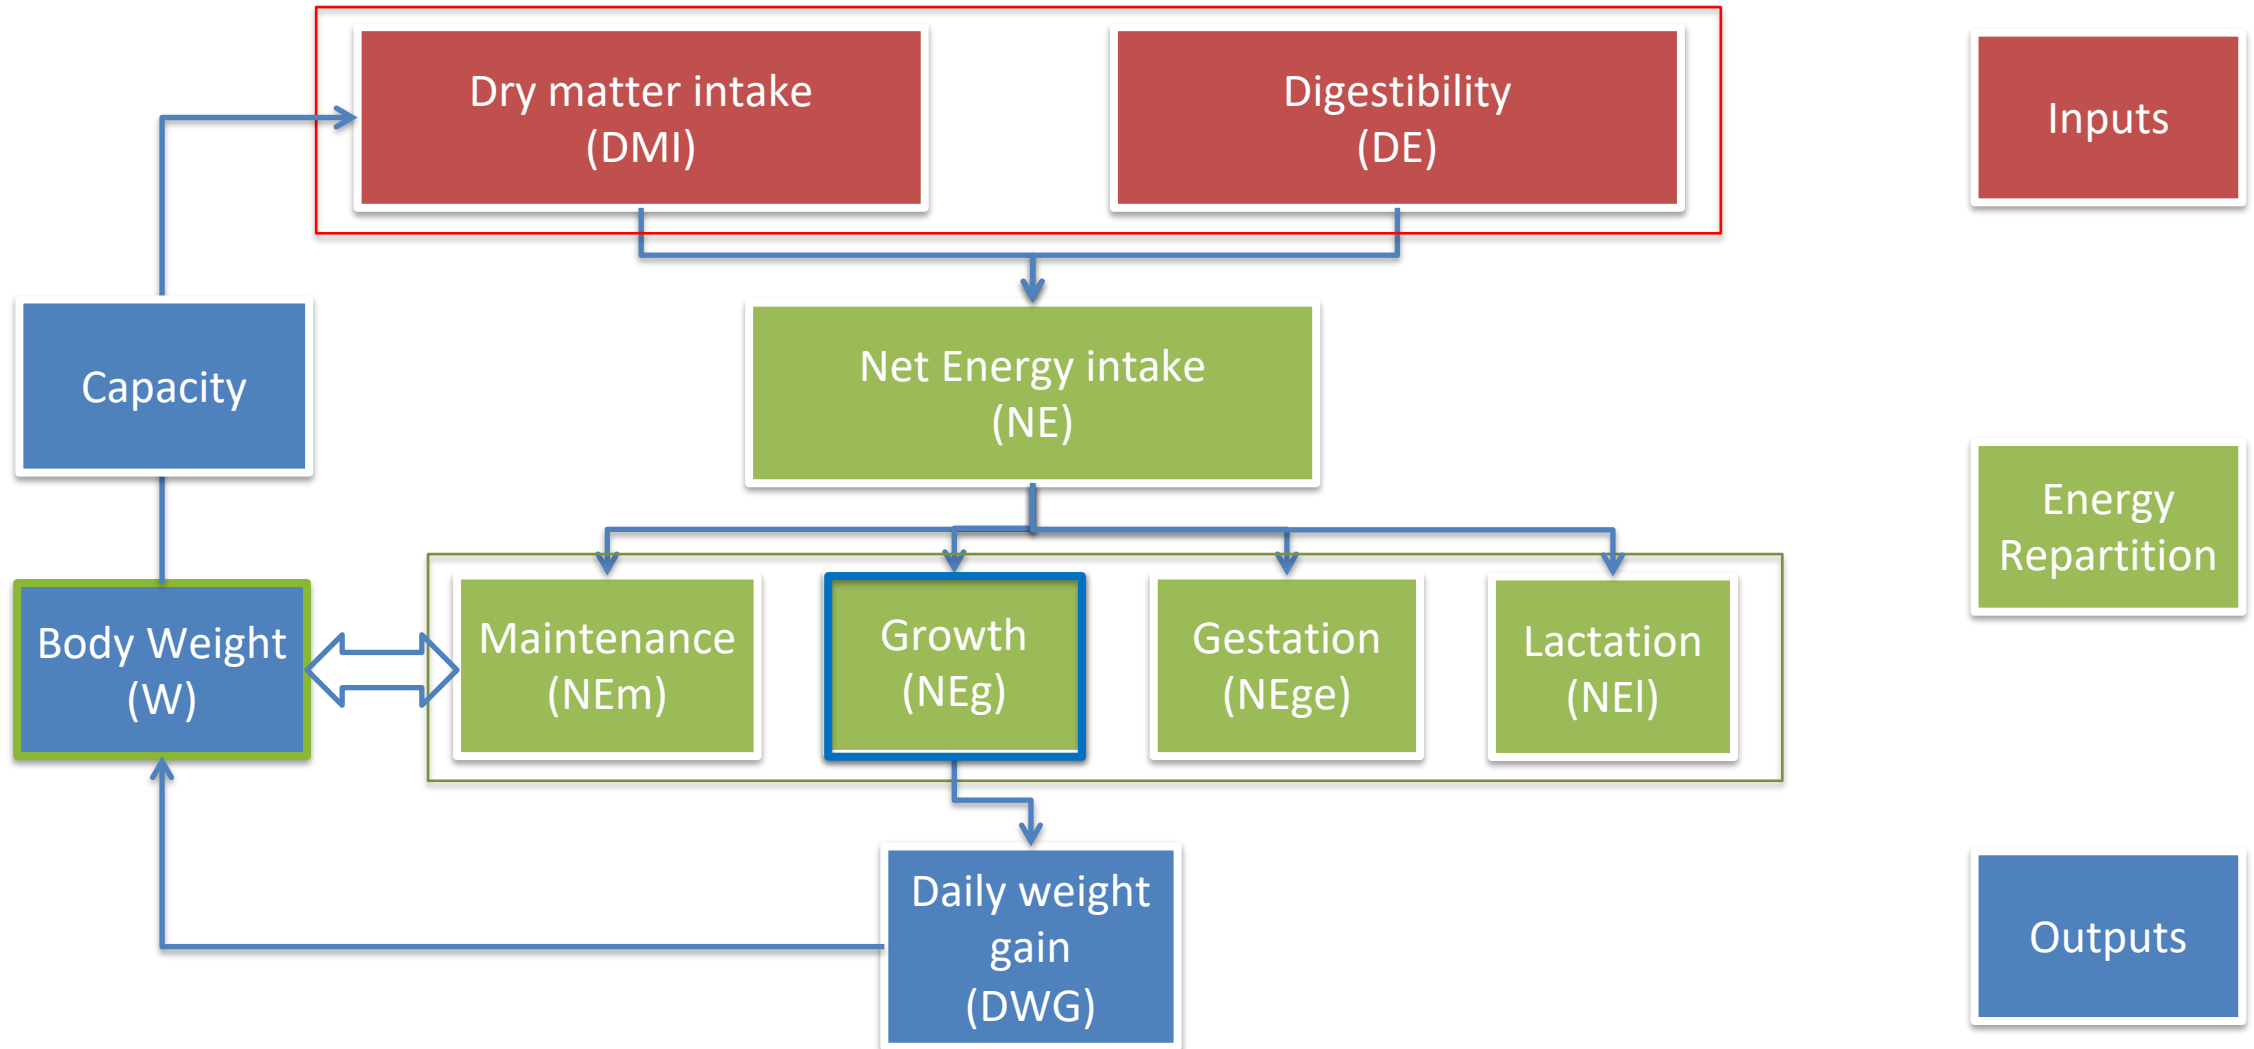

Feed Quality Digestibility (DE, %)	Y_m	Methane Yield, g CH ₄ / kg DMI
≥ 70	5.7	19
63-70	6.3	20.0
≤ 62	6.5	21.4

Methodology (schematic plan)

Framework of the quantitative model (e.g. pigs)

Feed Composition - Meat Quality (e.g. beef)

Animal Welfare

Grain-fed system:

- directed to fatten up
- ↑ diseases
- ↑ mortality
- ↑ restlessness

Grass-fed system:

- match to animal's natural metabolism
- ↓ psychological and physiological stress
- healthier
- ↑ Ability to perform natural behaviors
 - ↑ pregnancy rate
 - regular rest time

Scenarios of Changing Diet for Ruminants

Scenarios of Changing Diet for Ruminants

Scenarios of Changing Diet for Ruminants

Scenarios of Changing Diet for Ruminants

Scenarios of Changing Animal Numbers

The biggest difference between ruminants and monogastric animals :
RUMEN

- transfer human inedible fiber and protein into human edible nutrients
- methane emissions from enteric fermentation

Scenarios \ Livestock Unit	Ruminant Animals	Monogastric Animals
Baseline	255612	29522
+N of Ruminants/ -N of Monogastrics	+5%	-43%
-N of Ruminants/ +N of Monogastrics	-5%	+43%

CONCLUSION

- Diet composition is a bridge among animal production, impacts on the local land use and methane emission.
- **Cereals** addition provide a **possibility of win-win** on increasing animal meat production and reducing methane emission, but with a cost of **compromising the animal welfare**, and a risk of **intensifying food-feed competition and import needs**.
- **Changing livestock numbers and ratios** could be a lever to optimize the outputs.
- It's of importance on studying methane emission on the regional scale with a **multi-criteria approach**.

Future Perspectives

- Consolidate the model
- Applied and compare with other regions
- Optimize the diet composition in a multi-criteria approach
- Ameliorate herd dynamics
- Other GHG emissions
-

Thank you !
